IDENTIFIERS	*Indicators

ABSTRACT

Statistical information on educational indicators derived from studies conducted by the National Center for Educational Statistics (NCES) and from other studies and surveys is presented in a chartbook format. This year, the indicators are published in two volumes, one addressing elementary and secondary education, and the other postsecondary education. A third volume, "1989 Education Indicators," includes the text, tables, and graphs from the first two volumes and supplies technical supporting data, supplemental information, and data sources.) Indicators for postsecondary education have been grouped under the headings of outcomes, resources, and context. Outcome indicators include trends in completion (higher education attainment, degress conferred, and fields of study by race, ethnicity, and sex) and economic outcomes (young adult earnings and higher education research and development spending). Resource indicators focus on fiscal resources (college and university revenues and per student expenditures) and human resources (faculty salaries, new doctorates with jobs in education). Context resources focus entirely on student characteristics: enrollments by type and control of institution, selected personal characteristics, and enrollments by age group and ethnicity. Indicators have been added on degrees awarded according to fields of study and gender. Narrative discussions and charts depict each indicator; 19 supporting tables are appended. (MLH)

Highlights

The proportion of young adults (25 to 34 years old) with some college education rose more than 50 percent during the 1970s but then remained level in the 1980s. In 1988, nearly 5 out of 20 young adults had completed 4 or more years of college, while more than 7 of 20 had completed at least 2 years and about 9 of 20 had completed at least 1 year (*Indicator 2:1*).

Despite increases in the total number of bachelor's degrees conferred annually between 1971 and 1986, the number and proportion conferred in the humanities, social and behavioral sciences, natural sciences, and education fell. The field of education experienced the sharpest decline. During the same period, the number and proportion conferred in the computer sciences, business and management, engineering, and other technical/ professional fields rose substantially (*Indicator 2:3*).

The proportion of degrees earned by women increased at all levels between 1971 and 1986. By 1986, women were earning more than one-half of the associate degrees, about one-half of the bachelor's and master's degrees, and about one-third of the doctor's and first-professional degrees (*Indicator 2:7*).

Women earned an increasing share of the bachelor's and master's degrees awarded in business and management between 1971 and 1986. They also made important inroads in other fields, including the life, physical, and computer sciences. Despite substantial gains in these fields, women have not reached parity with men in many scientific and technological areas (*Indicator 2:8*).

The proportion of new doctorate recipients with definite employment commitments in the United States who had jobs in colleges and universities declined between 1971 and 1981. After 1981, the proportion with such jobs remained generally stable. The size and pattern of the changes varied by field of study (*Indicator 2:15*).

Between 1970 and 1983, enrollment in colleges and universities rose by 45 percent, from 8.6 million to 12.5 million. Since 1983, enrollments at all types of institutions have been relatively steady, but in 1987 and 1988 they were up slightly from 1985 levels (*Indicator 2:16*).

Commissioner's Statement

The National Center for Education Statistics (NCES) gathers and publishes information on the status and progress of education in the United States. The Federal authorization (enacted in 1974 but with antecedents to 1867) for these activities states that the Center will "collect, collate, and from time to time, report full and complete statistics on the condition of education in the United States" (section 406 (b) (1) of the General Education Provisions Act). This legislation mandated an annual statistical report from the Secretary of Education on the subject. In 1988, the Hawkins-Stafford Elementary/Secondary School Improvement Amendments (Public Law 100-297, amending section 406 (d)(1)(C) of the General Education Provisions Act) changed that reporting responsibility to be that of the Commissioner of Education Statistics.

This year, as in 1988, the "indicators"—key data that measure the health of education, monitor important developments, and show trends in major aspects of education—are published in three volumes. *The Condition of Education* report encompasses the first two volumes, the first addressing elementary and secondary education and the second, postsecondary education. The third volume, *1989 Education Indicators*, includes the text, tables, and graphs from the first two volumes, plus the technical supporting data, supplemental information, and data sources.

NCES began presenting statistical information as education indicators with the 1986 edition of *The Condition of Education*. Since then, the indicators have been developed through studies carried out by the Center as well as from surveys conducted elsewhere, both within and outside the Federal Government. Although indicators may be simple statistics, more often they are analyses—examining relationships; showing changes over time; comparing or contrasting subpopulations, regions, or States; or studying characteristics of students from different backgrounds. Data used for these indicators are the most valid and representative education statistics available in America today for the subjects and issues with which they deal.

Not all possible indicators are published in a given edition. No more than a total of 40-50 indicators is presented in each year's report. By contrast, the Center's other major annual compendium, the *Digest of Education Statistics*, includes more than 300 statistical tables, plus figures and appendices. The indicators, therefore, represent a consensus of professional judgment on the most significant national measures of the condition and progress of education at this time, but tempered, necessarily, by the availability of current and valid information. The indicators reflect a basic core that can be repeated with updated information every year and supplemented by a more limited set of indicators based on infrequent or one-time studies.

Those indicators in the elementary and secondary education volume derive more from comprehensive data collected over time, while those in the postsecondary volume are based on more recently developed data, reflecting a narrower array of topics described by currently available timetrends and nationally representative statistics.

For elementary and secondary education, new indicators include:

- a science indicator from the most recently completed analysis of the National Assessment of Educational Progress;
- indicators on international comparisons of mathematics and science proficiency;
- an indicator on the racial and ethnic composition of elementary/secondary education, based on data from the Office for Civil Rights; and
- an indicator on the number of credits required by States for graduation from high school from new data of the Council of Chief State School Officers.

The expanded set of postsecondary indicators presented in 1988 is continued this year with selected additions. Indicators have been added on degrees awarded by colleges and universities according to the fields of study and gender of students. The National Science Foundation has provided new data on research and development spending by universities and trends in new doctorate recipients' entering university employment.

The concept of education indicators has gained the attention of the U.S. Congress, national organizations, States, and localities. To assist the Center in conceptualizing and developing a set of education indicators most useful to policymakers and researchers, Congress recently mandated that NCES convene a special study panel of experts to "make recommendations concerning the determination of education indicators for study and report" (P.L. 100-297). The Commissioner is to submit the report of the panel to Congress upon completion of its work. NCES expects to revise *The Condition of Education* to reflect those recommendations. The panel will meet over the coming year. Its conclusions, however, will not greatly influence the 1990 edition of *The Condition of Education*, but its work could result in major changes beginning in 1991.

In developing indicators, the Center has participated in a widening national discussion about the types of measures that are useful in monitoring the progress of education. A number of local education agencies and States, such as California and Connecticut, are monitoring their reform agendas through education indicators. At the national level, the Council of Chief State School Officers seeks to have consistent reporting by the States on a number of indicators that it has identified.

In future editions, the utility of this report should increase as more diverse, high quality data become available, especially as new time series can be constructed. Elementary and secondary education data will be enhanced by revisions in the basic data collected about public schools in the Common Core of Data survey and by the results from the Schools and Staffing Survey (SASS), which covers both public and private schools. Some data from the first SASS are expected to be analyzed in time for the 1990 edition.

Data collection from more postsecondary institutions than the traditional, accredited 2- and 4-year colleges and universities has already begun. This expanded system, called the Integrated Postsecondary Education Data System (IPEDS), also includes information from nonaccredited institutions whether they are public or private, 4-year, 2-year, or less-than-2-year. Information from this broader group of institutions will provide a much clearer picture of what is happening in the full scope of postsecondary education.

Finally, the format of *The Condition of Education* is designed to present statistical information in an accessible manner for a general audience. As in the 1988 edition, the one-page narrative style is followed by an illustrative chart. The tables supporting each narrative and chart are placed in an appendix.

I hope you find the material helpful and invite you to send us comments on how to make future editions even more useful.

Emerson J. Elliott
Acting Commissioner of
Education Statistics

Acknowledgments

The Condition of Education was prepared in the National Center for Education Statistics (NCES), Office of Educational Research and Improvement (OERI), by the Indicators and Multilevel Studies Branch of the Crosscutting Education Statistics and Analysis Division under the general supervision of Jeanne E. Griffith, Acting Division Director.

Curtis O. Baker, Acting Chief of the Indicators and Multilevel Studies Branch, coordinated the development and production of this edition after taking over from Carlyle Maw, who is now in the NCES Office of the Chief Statistician. Laurence Ogle, Gayle Rogers, and Mark Schwartz of the branch contributed indicators, both new and updated. Mary Frase was consulted for technical guidance and provided a challenge to improve the readability of the indicators. Brenda Wade helped type the manuscript and assemble the final document.

The staff members of the NCES Compilations, Projections, and Special Studies Branch were especially helpful. As the ones responsible for the preparation of the *Digest of Education Statistics*, they were a continuing source of advice on the problems associated with various data sets. Thomas Snyder, Charlene Hoffman, and Lisa Avallone helped with many indicators. Debra Gerald and Paul Horn provided projections data.

Cynthia Hearn Dorfman from Information Services of OERI directed the publication of this edition with help from Lance Ferderer and Kate Dorrell. Phil Carr designed the cover.

From outside the Department of Education, the following people provided help in the collection and interpretation of data: Howard Hayghe, Diane Herz, and Wayne Howe from the Bureau of Labor Statistics; Susan Hill, Marge Macher, and Murray Aborn from the National Science Foundation; Daniel Pasquini from the National Research Council; and Paul Siegel and Wendy Bruno from the Bureau of the Census.

Several individuals served as invited external peer reviewers. They were: Peter Benson, President, Search, Inc.; Mary Crovo, Chief, Research, Evaluation and Statistical Services, Maryland State Department of Education; James Firnberg, former president of Louisiana State University—Alexandria; Virginia Hodgkinson, Vice President, Independent Sector; Lucie Lapovsky, Director, Division of Finance and Facilities, Maryland Higher Education Commission; Heidi Mahoney, Associate

Vice President for Academic Planning, SUNY College at Fredonia; Diane Scott-Jones, Associate Professor of Educational Psychology, University of Illinois. Jim Fox from the Office of Research , OERI, also served as a peer reviewer.

Douglas Wright, Office of the Chief Statistician (NCES), provided guidance on statistical interpretation and adjudicated the final document.

NOTE: These acknowledgments recognize only those who developed new indicators for this edition and who updated indicators repeated from the 1986 and 1987 editions. Mention is not made of those who contributed to the initial development of continuing indicators and who were identified in earlier editions.

Indicators of Postsecondary Education

A. Outcomes

Completions

2:1 Trends in higher education attainment 8
2:2 Degrees conferred, by level 10
2:3 Bachelor's degrees conferred, by field 12
2:4 Advanced degrees conferred, by field 14
2:5 Degrees conferred, by race and ethnicity 16
2:6 Field of study, by race and ethnicity 18
2:7 Degrees earned by women 20
2:8 Fields of study among women 22
2:9 Degrees earned by foreign students 24

Economic Outcomes

2:10 Earnings of young adults, by educational attainment 26
2:11 Higher education spending on research and development 28

B. Resources

Fiscal Resources

2:12 Revenues of colleges and universities 32
2:13 Allocation of expenditures per student and tuition levels 34

Human Resources

2:14 Faculty salaries, by academic rank 36
2:15 New doctorates with jobs in higher education, by field 38

Contents

C. Context

Student Characteristics

2:16 College and university enrollment, by type and control of institution 42
2:17 Selected characteristics of students in higher education 44
2:18 College enrollment, by selected age groups 46
2:19 Enrollment patterns in higher education, by race and ethnicity 48

Tables

Indicator 2:1

2:1-1 Years of college completed by population 25-34 years old, by race and ethnicity: 1970-1988 52

Indicator 2:2

2:2-1 Number of degrees conferred at institutions of higher education, by level of degree: Academic years ending 1971-1986 54
2:2-2 Percent change in the number of degrees conferred at institutions of higher education since 1971, by level of degree: Academic years ending 1972-1986 55

Indicator 2:3

2:3-1 Number of bachelor's degrees conferred, by field of study: Selected academic years ending 1971-1986 56
2:3-2 Percent change in number of bachelor's degrees conferred since 1971, by field of study: Selected academic years ending 1973-1986 57
2:3-3 Percentage distribution of bachelor's degrees conferred, by field of study: Selected academic years ending 1971-1986 58

Indicator 2:4

2:4-1 Number of master's degrees conferred, by field of study: Selected academic years ending 1971-1986 59

Page

2:4-2 Percent change in number of master's degrees conferred since 1971, by field of study: Selected academic years ending 1973-1986 60

2:4-3 Percentage distribution of master's degrees conferred, by field of study: Selected academic years ending 1971-1986 61

2:4-4 Number of doctor's degrees conferred, by field of study: Selected academic years ending 1971-1986 62

2:4-5 Percent change in number of doctor's degrees conferred since 1971, by field of study: Selected academic years ending 1973-1986 63

2:4-6 Percentage distribution of doctor's degrees conferred, by field of study: Selected academic years ending 1971-1986 64

Indicator 2:5

2:5-1 Number of degrees conferred, by race and ethnicity and degree level: Selected academic years ending 1977-1985 65

2:5-2 Percent change in number of degrees conferred between academic years ending 1977 and 1985, by race and ethnicity, degree level, and gender 67

2:5-3 Number of degrees conferred, by race and ethnicity, degree level, and gender: Academic years ending 1977 and 1985 68

Indicator 2:6

2:6-1 Percentage distribution of bachelor's degrees, by field and race and ethnicity: Selected academic years ending 1977-1985 69

2:6-2 Percentage distribution of master's degrees, by field and race and ethnicity: Selected academic years ending 1977-1985 72

2:6-3 Percentage distribution of doctor's degrees, by field and race and ethnicity: Selected academic years ending 1977-1985 75

2:6-4 Number of bachelor's degrees conferred, by field and race and ethnicity: Selected academic years ending 1977-1985 78

Contents

Page

2:6-5 Number of master's degrees conferred, by field and race and ethnicity: Selected academic years ending 1977-1985 81

2:6-6 Number of doctor's degrees conferred, by field and race and ethnicity: Selected academic years ending 1977-1985 84

Indicator 2:7

2:7-1 Percent of degrees earned by women, by degree level: Academic years ending 1971-1986 87

2:7-2 Number of degrees conferred, by degree level and gender: Academic years ending 1971-1986 88

Indicator 2:8

2:8-1 Percent of bachelor's degrees earned by women, by field of study: Selected academic years ending 1971-1986 90

2:8-2 Number of bachelor's degrees earned by women, by field of study: Selected academic years ending 1971-1986 91

2:8-3 Percent of master's degrees earned by women, by field of study: Selected academic years ending 1971-1986 92

2:8-4 Number of master's degrees earned by women, by field of study: Selected academic years ending 1971-1986 93

2:8-5 Percent of doctor's degrees earned by women, by field of study: Selected academic years ending 1971-1986 94

2:8-6 Number of doctor's degrees earned by women, by field of study: Selected academic years ending 1971-1986 95

Indicator 2:9

2:9-1 Number of degrees earned by foreign students, by field and degree level: Selected academic years ending 1977-1985 96

2:9-2 Percent of degrees earned by foreign students, by field and degree level: Selected academic years ending 1977-1985 98

2:9-3 Postgraduation plans of foreign doctorate recipients with temporary U.S. visas, by major field: Academic years ending 1976-1987 100

Page

Indicator 2:10

2:10-1 Median earnings and earnings ratios of year-round, full-time workers 25-34 years old, by educational attainment and by race and gender: 1978-1988 101

2:10-2 Median earnings of year-round, full-time workers 25-34 years old, by educational attainment and by race and gender: 1978-1988 102

Indicator 2:11

2:11-1 Research and development (R&D) expenditures at doctorate-granting institutions, by source of funds: Fiscal years 1972-1987 103

Indicator 2:12

2:12-1 Percentage distribution of general education revenues of higher education, by control and level of institution and source of revenue: Fiscal year 1986 104

2:12-2 General education revenues in *current* dollars for institutions of higher education, by control of institution and source of revenue: Selected fiscal years 1976-1986 106

2:12-3 General education revenues in *constant* 1986 dollars for institutions of higher education, by control of institution and source of revenue: Selected fiscal years 1976-1986 108

Indicator 2:13

2:13-1 Index of expenditures in constant dollars per full-time-equivalent student at *public* institutions of higher education, by type of institution: Academic years ending 1977-1986 110

2:13-2 Index of expenditures in constant dollars per full-time-equivalent student at *private*, nonprofit institutions of higher education, by type of institution: Academic years ending 1977-1986 112

Page

2:13-3 Index of average undergraduate tuition charges in *constant* dollars at institutions of higher education, by type and control of institution: Academic years ending 1977-1986 114

Indicator 2:14

2:14-1 Average faculty salaries in *constant* 1985-86 dollars in institutions of higher education, by academic rank and control and type of institution: Academic years ending 1972-1986 115

2:14-2 Average faculty salaries in *current* dollars in institutions of higher education, by academic rank and control and type of institution: Academic years ending 1972-1986 118

2:14-3 Index of average salaries in *current* dollars of full-time instructional faculty in institutions of higher education, by academic rank and selected other professional occupations in medium-sized and large private firms: Academic years ending 1972-1986 121

Indicator 2:15

2:15-1 Percent of new doctorates with definite employment plans in the United States who have commitments at colleges and universities, by field of study: Selected years of doctorate 1971-1987 123

2:15-2 Number of new doctorates with definite employment plans in the United States who have commitments at colleges and universities, by field of study: Selected years of doctorate 1971-1987 124

2:15-3 Number of new doctorates, by postgraduate plans: Selected years of doctorate 1971-1987 125

2:15-4 Percent of new doctorates with definite employment plans in the United States with commitments in employment sectors other than higher education, by selected field of study: Selected years of doctorate 1971-1987 126

Indicator 2:16

2:16-1 Enrollments in institutions of higher education, by type and control of institution: Selected years 1970-1988 128

Page

Indicator 2:17

2:17-1 Trends in total enrollment of part-time students, women, students 25 years old or older, and graduate and professional students in institutions of higher education: Selected years 1970-1988 129

Indicator 2:18

2:18-1 Population and college enrollment, by selected age groups: 1980-1986 130

Indicator 2:19

2:19-1 Participation rates of 18- to 24-year-olds in higher education, by race and ethnicity: 1970-1986 131

Introduction

Institutions of higher education are being challenged to prepare students to deal with the complex problems facing the country, including the demands of increasingly competitive world markets and long-term economic and technological growth. Growing emphasis on the need to evaluate what colleges teach and what college students study and learn is, at least in part, a response to these issues.

Colleges and universities also face pressure to curb increasing costs. Rising tuition levels have caused considerable concern about students' ability to afford college education. As a result, the public has turned its attention to how higher education institutions spend their money and how much they charge students in tuition and fees. Another problem confronting these institutions concerns the enrollment of low income and minority students in higher education.

The indicators in this volume provide information important to the public debate of these and related issues. On the positive side, enrollments in colleges and universities continued to grow in size and diversity in the 1980s. Enrollments increased despite a decline in the traditional, college-age population. The total number of degrees and the number awarded to racial and ethnic minorities, except blacks, also increased. A college education continued to make an important difference in workers' earnings. Research and development expenditures at academic institutions grew considerably. Faculty salaries recaptured some of their earlier losses in purchasing power.

Some less encouraging trends also occurred in the 1980s. Tuition increased substantially, as did most types of higher education expenditures. A smaller percentage of Americans earned degrees in scientific and engineering fields, while the foreign student presence in these fields—especially at the graduate level—grew. These trends have created concern about the country's ability to replace an aging work force and to remain competitive internationally. Finally, despite population growth and stable participation rates, the number of degrees earned by black males decreased at all degree levels.

Context

Higher education has been confounding prognosticators for years. Despite the decline in the 18- to 24-year-old population, enrollments have not declined, but rather have increased (*Indicators 2:16* and *2:18*). While the number of individuals in the traditional age group of most college students (18- to 24-year-olds) has declined, their participation rate has increased. At the same time, the participation rate of those over the age of 25 has also increased (*Indicator 2:18*). Enrollment of part-time students and women students continues to increase (*Indicator 2:17*). However, after years of increasing participation by blacks and Hispanics, the participation rates for these groups were no higher in 1986 than in 1976 (*Indicator 2:19*). The increase in enrollment, therefore, has carried with it long-term changes altering the student body in ways that have challenged the system.

Outcomes

Students in higher education have become more oriented towards business and technology. Both the share and the number of students completing degrees in education and the liberal arts have declined, while those in business, computer sciences, and engineering have increased (*Indicators 2:3* and *2:4*). These changes in the selection of majors are pervasive among all students. They have occurred in all racial/ethnic groups (*Indicator 2:6*).

Women have increased their percentage of degrees earned in higher education at all degree levels (*Indicator 2:7*). They have also dramatically increased their numbers of degrees in areas that used to be dominated by men, such as business, engineering, and computer science, as well as many other fields (*Indicator 2:8*).

Foreign students now account for more than 20 percent of master's degrees in mathematics, computer science, and engineering. They also account for more than 25 percent of the doctor's degrees in these same three fields, with the total in engineering over 40 percent (*Indicator 2:9*).

The attainment of a degree, whether bachelor's, master's, doctor's, or first-professional is a step on the way to employment. In general, the percentage of 25- to 34-year-olds who have completed 4 years of college has stabilized in the past few years. Degrees awarded to minorities are not increasing consistent with their participation (*Indicator 2:19*). Nor is the rate of degree attainment increasing in general (*Indicator 2:5*). This is particularly problematic for blacks, because the financial advantage of a college degree over a high school diploma is great, and this advantage is greater for blacks than for whites (*Indicator 2:10*).

Financing of Higher Education

The sources of revenues for institutions of higher education have not changed in recent years (*Indicator 2:12*). While the revenue sources have been relatively stable, expenditures per full-time-equivalent student, including those for instruction, have been increasing at a faster rate than inflation (*Indicator 2:13*). Faculty salaries, while increasing, are still lower in constant dollar terms than they were in the 1970s (*Indicator 2:14*). While the total amount of research and development spending has continued to increase in recent years, the proportion attributed to the Federal Government has been declining. Institutions have been replacing those funds with funds from industry and their own institutional resources (*Indicator 2:11*).

Conclusion

The indicators presented in this volume provide insights into the condition of colleges and universities. Higher education has reached a plateau. Participation rates of minorities and women seem to have stabilized, as have educational attainment levels. But some indicators suggest considerable progress while others identify potential problems.

Discouraging indicators show that the numbers of degrees awarded to men, particularly black men, have gone down. Foreign students are increasingly dominant at the higher degree levels in engineering. There is a distinct shift away from concentration in the liberal arts to business and technology. Also discouraging are the rapidly rising tuition levels and the lagging faculty salaries that fall behind the levels of the early 1970s.

Encouraging indicators are those showing that more students over 25 are participating in higher education and that women have moved into many fields in which their representation has been low. Research and development funds have not declined despite reductions in Federal funding.

A. Outcomes

A. Outcomes: Completions

Indicator 2:1 Trends in higher education attainment

- **The proportion of young adults (25 to 34 years old) with some college education rose more than 50 percent during the 1970s, and then remained level in the 1980s.**
- **In 1988, nearly 5 out of 20 young adults had completed 4 or more years of college, while more than 7 of 20 had completed at least 2 years and about 9 of 20 had completed at least 1 year.**

The Nation's educational growth has an impact on its social and economic life, affecting the welfare of individuals, families, and the Nation as a whole. Trends in years of college completed indicate changes in the educational level of the country's work force and thus provide clues to current and future socioeconomic conditions.

The pattern of higher education attainment of the 25- to 34-year-old population is shown below.

	Years of college completed		
Year	1 or more	2 or more	4 or more
		Percent	
1970	30	24	16
1976	41	34	23
1982	45	37	24
1988	45	37	24

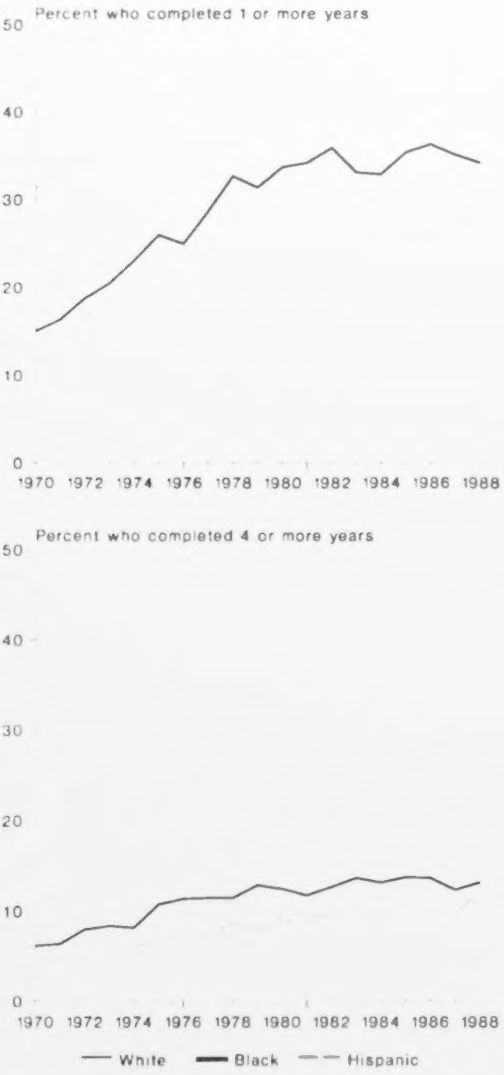
Despite gains made by blacks and Hispanics, minority attainment in higher education still lags behind that of whites. For blacks, rates of college attendance, * after rapid growth in the 1970s, stabilized in the 1980s at a little over 33 percent. Hispanic rates increased in the 1980s, but at 29 percent in 1988, their attendance rates still remain below those for both whites and blacks.

---

* For purposes of this indicator, "college attendance" is defined as completing at least 1 year of college.

SOURCE: U.S. Department of Commerce, Bureau of the Census, "Educational Attainment in the United States," various years, *Current Population Reports*, Series P-20 and unpublished tabulations from the March supplement to the Current Population Survey.

Chart 2:1 Trends in the number of years of college completed by 25- to 34-year-olds: 1970–1988



SOURCE: Bureau of the Census, *Current Population Reports*, various years.

Indicator 2:2 Degrees conferred, by level

- **The total number of degrees conferred by American colleges and universities increased 31 percent between 1971 and 1983, but growth has been flat since then.**
- **Associate and first-professional degrees showed the greatest proportionate increases during the 1971 through 1986 period, rising 77 and 95 percent, respectively.**

Trends in the number of degrees conferred provide a sense of the productivity of the Nation's system of colleges and universities and provide clues to the level of trained individuals in the society. In the last 15 years, the number of degrees awarded annually rose from 1.4 to 1.8 million. The numbers and relative growth at each degree level contrasted substantially, however, reflecting changing interests and educational goals of students.

Between 1971 and 1986, the number of bachelor's degrees conferred rose 18 percent, from nearly 840,000 to nearly 988,000. This growth was not steady, however. The number climbed during the early- to mid-1970s, but then fell sharply in 1975 and remained relatively level through the latter half of the decade. In 1980, a consistent upswing began. The number awarded in 1986 represented an all-time high.

Associate and first-professional degrees grew rapidly over much of the period. Recently, however, growth at these levels has tapered off or declined. Master's degrees, following substantial growth in the early- and mid-1970s, declined consistently until 1984, but then shifted upward slightly. The number of doctor's degrees changed very little over the 1971 through 1986 period, ranging from a low of a little over 32,000 in 1971 to a high of nearly 35,000 in 1973.

A. Outcomes: Completions

Indicator 2:3 Bachelor's degrees conferred, by field

- **Although the total number of bachelor's degrees increased between 1971 and 1986, the number and proportion conferred in the humanities, social and behavioral sciences, natural sciences, and education fell. Education experienced the sharpest decline.**
- **Over the same period, the number and proportion of degrees conferred in the computer sciences, engineering, business and management, and other technical/professional fields rose substantially.**

Shifts in student preferences for fields of study, as reflected in changes in the number and proportion of bachelor's degrees conferred in different fields, can profoundly affect the demand for courses and the supply in various job markets. For this reason, college administrators, employers, employment analysts, and others keenly follow the trends in bachelor awards.

Between academic years ending 1971 and 1986, student interest in the social and behavioral sciences and in education dropped substantially. The decline occurred over most of the period but has slowed or leveled off recently. Interest in the humanities and in the natural sciences also dropped during the period. The drop in the number of degrees conferred in the natural sciences (life sciences, physical sciences, and mathematics) was due to sharp declines in mathematics degrees which fell each year between 1971 and 1981 before turning upward.

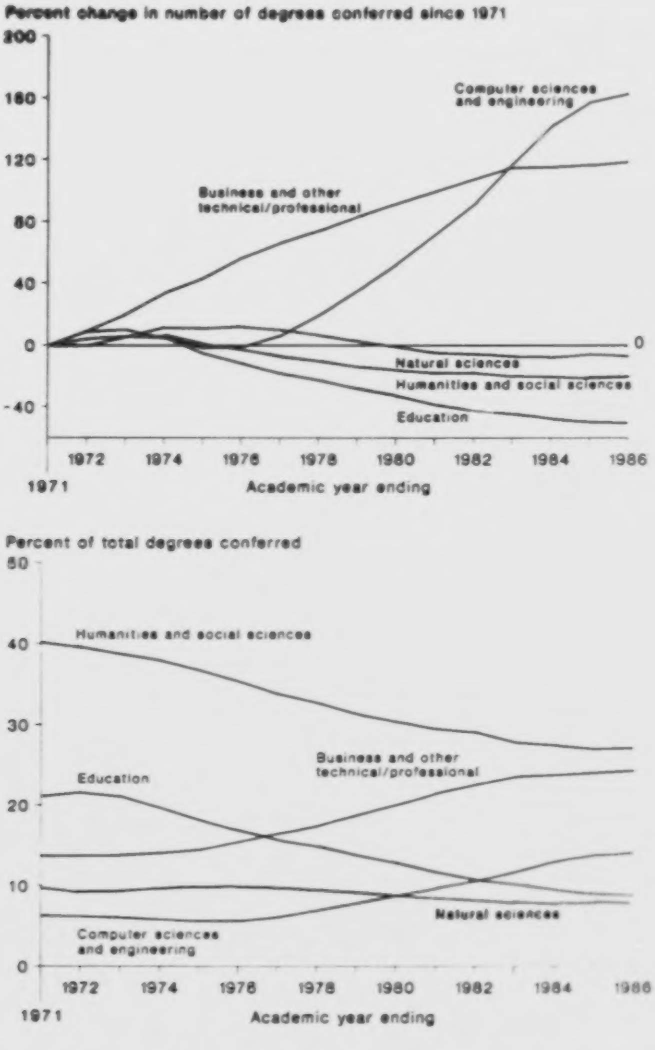
Other fields became more popular during the period. Interest in both the computer sciences and engineering increased considerably. Business and management and other technical/professional fields * grew dramatically as well. The proportion of bachelor's degrees earned in the latter two categories combined grew from 23 to 43 percent between 1971 and 1986.

---

* Other technical/professional fields are: agriculture, architecture, communications and communications technologies, health sciences, home economics, law, library science, military science, parks and recreation, protective services, and public affairs.

SOURCE: U.S. Department of Education, National Center for Education Statistics, *Digest of Education Statistics, 1988* (based on the HEGIS survey Degrees and Other Formal Awards Conferred, various years).

Chart 2:3 Bachelor's degrees conferred, by field of study: Academic years ending 1971–1986



SOURCE: U.S. Department of Education, National Center for Education Statistics, surveys of degrees conferred, various years.

Indicator 2:4 Advanced degrees conferred, by field

- **The number and proportion of master's degrees conferred in the humanities, social and behavioral sciences, natural sciences, and education were lower in 1986 than in 1971, whereas those in the computer sciences and engineering, business, and other technical/professional fields were substantially higher.**
- **At the doctoral level, the number and proportion of degrees conferred in the natural sciences and in engineering were lower in 1986 than in 1971, while the number and proportion in other fields were higher or about the same.**

Trends in students' fields of concentration provide important information on changing student interests and responses to the labor market. They may also provide clues about ongoing or future changes in the demand for faculty in different disciplines.

Since 1971, the distribution of master's degrees has shifted away from the humanities, social and behavioral sciences, and education toward business and other technical/professional fields.* The most dramatic change has occurred in the balance between education and business degrees. In 1971, education was by far the most popular field at the master's level. Since the mid-1970s, however, specialization in education has decreased, while it has grown markedly in business. As a result, by 1986, the two fields were about equally popular, each accounting for about one-quarter of all master's degrees.

Specialization in the natural sciences (life sciences, physical sciences, and mathematics) at the master's level, particularly in mathematics, declined during much of the period from 1971 to 1986. Computer and information sciences grew substantially in popularity throughout the period. Engineering gained in the 1980s following a decline in the previous decade.

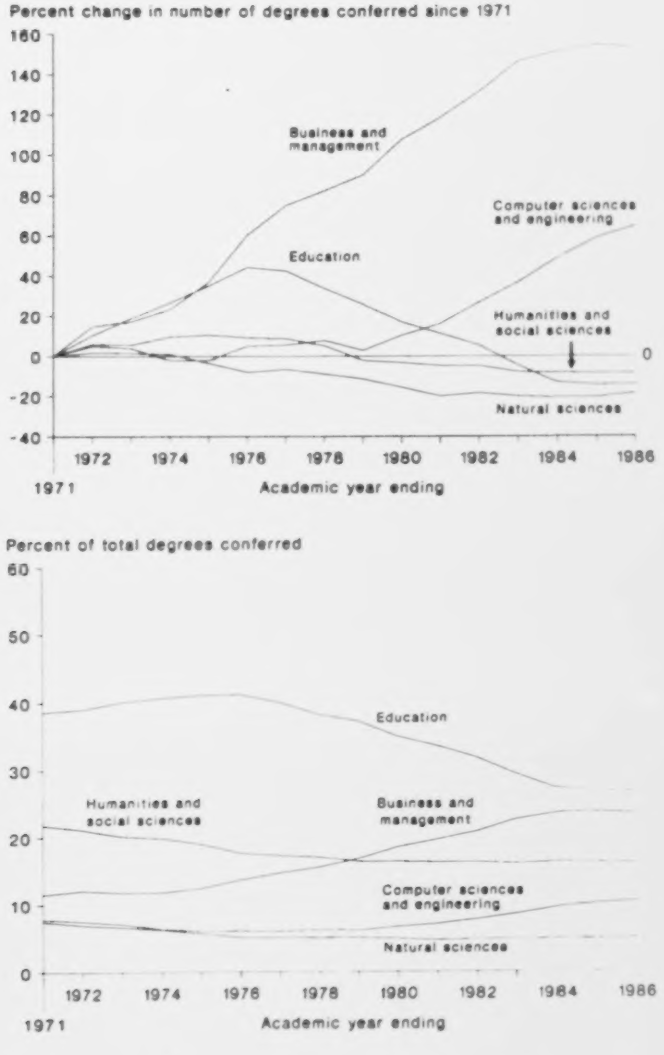
The total number of doctor's degrees conferred annually changed very little between 1971 and 1986. While the number of degrees in many fields increased, there were significant declines in the natural sciences and in engineering: mathematics degrees declined 38 percent, physical sciences 19 percent, life sciences 8 percent, and engineering 6 percent.

---

* Other technical/professional fields are: agriculture, architecture, communications and communications technologies, health sciences, home economics, law, library science, military science, parks and recreation, protective services, and public affairs.

SOURCE: U.S. Department of Education, National Center for Education Statistics, *Digest of Education Statistics, 1988* (based on the HEGIS survey Degrees and Other Formal Awards Conferred, various years).

Chart 2:4 Master's degrees conferred, by field of study: Academic years ending 1971–1986



SOURCE: U.S. Department of Education, National Center for Education Statistics, surveys of degrees conferred, various years.

Indicator 2:5 Degrees conferred, by race and ethnicity

- **Despite an increase in the young adult, black population, blacks earned fewer bachelor's, master's, and doctor's degrees in 1985 than in 1977. They did earn more first-professional degrees, however.**
- **Between the same years, whites earned fewer master's and doctor's degrees but more bachelor's and first-professional degrees.**
- **The number of degrees earned by Hispanics, Asians, and American Indian/ Alaskan Natives increased at all levels .**

The ability of our colleges and universites to attract and retain minority students is important to the Nation's success in achieving its goal of equal opportunity. Change in the number of degrees earned by minorities in relation to their population provides one measure of higher education's progress toward this goal.

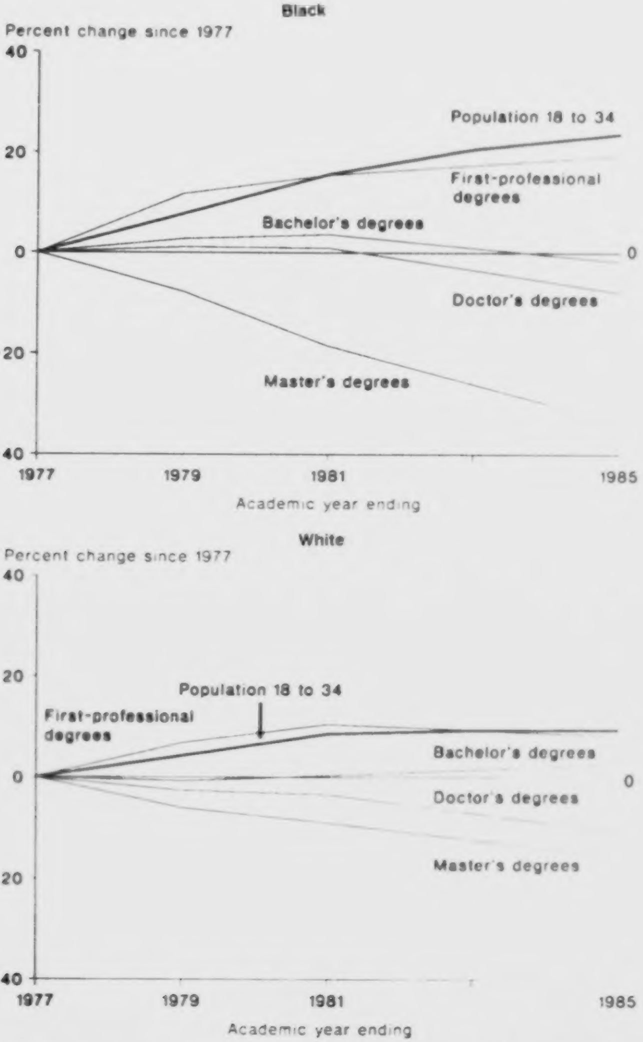
Between 1977 and 1985, changes in the number of degrees earned by blacks and whites at the various degree levels exhibited some similarities. Both groups earned fewer master's and doctor's degrees and more first-professional degrees in 1985 than in 1977. In addition, except at the master's level, men of both races earned fewer degrees at all levels, whereas women of both races earned more. Finally, among men, the declines were as sharp among whites as among blacks at all but the master's level.

Despite the similarities, there were important differences between the two racial groups. In general, growth in the young adult population (ages 18 to 34) outpaced degree growth to a much larger extent among blacks than among whites. The black young adult population grew 24 percent between 1977 and 1985, but the number of bachelor's and advanced degrees awarded to blacks fell by 2 and 27 percent, respectively. In contrast, the white young adult population increased 9 percent, while the number of bachelor's degrees awarded to whites increased 3 percent and the number of advanced degrees decreased 11 percent.

Another difference between the two racial groups is the size of the changes in degrees earned by women. The increases were smaller and the declines sharper, in percentage terms, among black than among white women.

U.S. Department of Commerce, Bureau of the Census, "Estimates of the Population of the United States, by Age, Sex, and Race," *Current Population Reports*, Series P-25, Nos. 917 and 1000.

Chart 2:5 **Percent change since 1977 in population and number of degrees earned by blacks and whites: Selected academic years ending 1977–1985**



SOURCE: U.S. Department of Education, National Center for Education Statistics and Office for Civil Rights, surveys of degrees conferred, various years. Bureau of the Census, *Current Population Reports*, Series P-25, Nos. 917 and 1000.

Indicator 2:6 Field of study, by race and ethnicity

- **The proportion of bachelor's degrees conferred in the natural sciences remained about the same during the period from 1977 to 1985 among both minority and white students.**
- **At all degree levels, engineering was generally more popular in 1985 than in 1977 among students in all racial/ethnic groups, especially among Asian students.**

The fields pursued by college students from different racial/ethnic groups affect the career opportunities open to those from different backgrounds and the racial/ethnic distribution of different occupations. One issue currently of concern is that the level of minority students specializing in science and engineering is low. According to one view, the country needs to encourage minorities to pursue studies in these fields in order to help avert a potential national manpower shortage.*

Racial/ethnic groups differ substantially in the fields they study. The most pronounced differences from 1977 to 1985 were in the proportion of degrees earned in the natural sciences (life sciences, physical sciences, and mathematics), engineering, and education.

The natural sciences and engineering were much more popular among Asian students than among the students of any other racial/ethnic group during the 1977 through 1985 period. At all levels, the proportion of degrees conferred in engineering was generally higher in 1985 than in 1977 among students in all racial/ethnic groups. This growth was low to moderate, however, among all but Asian students. In contrast, the natural sciences did not become more popular during the period in any of the groups.

With few exceptions, the field of education declined in popularity among students at all degree levels, regardless of their race/ethnicity. The declines were steepest among black students. Despite the large drops, education remains by far the most popular field among all non-Asian minority groups at the master's level.

Indicator 2:7 Degrees earned by women

- **The proportion of associate and bachelor's degrees earned by women increased from 43 percent at each level in 1971 to 56 and 51 percent, respectively, in 1986.**
- **The proportion of advanced and professional degrees earned by women also increased between those years. Growth was particularly dramatic at the doctor's and first-professional levels.**
- **By 1986, women were earning more than one-half of the associate degrees, about one-half of the bachelor's and master's degrees, and about one-third of the doctor's and first-professional degrees.**

Historically, women have earned substantially fewer degrees than men. A concern is whether and how much the differences between men and women have narrowed or disappeared at the various degree levels.

Women have increased their participation at all degree levels since 1971. Between that year and 1986, their share of associate degrees grew from 43 to 56 percent on a generally upward path. Much of this growth took place in the 1970s. Their share of bachelor's and master's degrees reached the 50 percent level in 1981, up from 43 and 40 percent, respectively, in 1971. In 1986, women continued to earn about one-half of both types of degrees.

Women also have increased their share of first-professional and doctor's degrees. In 1971, they earned only 6 percent of the first-professional degrees and 14 percent of the doctor's degrees. Since then, they have received an increasing proportion of these degrees, earning about one-third of each type in 1986.

Much of the growth in the women's share of degrees resulted from substantial increases in the number of degrees earned by women, but some occurred because of decreases in the number of degrees earned by men. At the bachelor's level, for example, the number of women earning degrees rose throughout the 1971 through 1986 period. In comparison, the number of men earning degrees at that level peaked in 1974 and then declined until 1981. Although the number of degrees earned by men has increased since then, it remains below the level of the early 1970s.

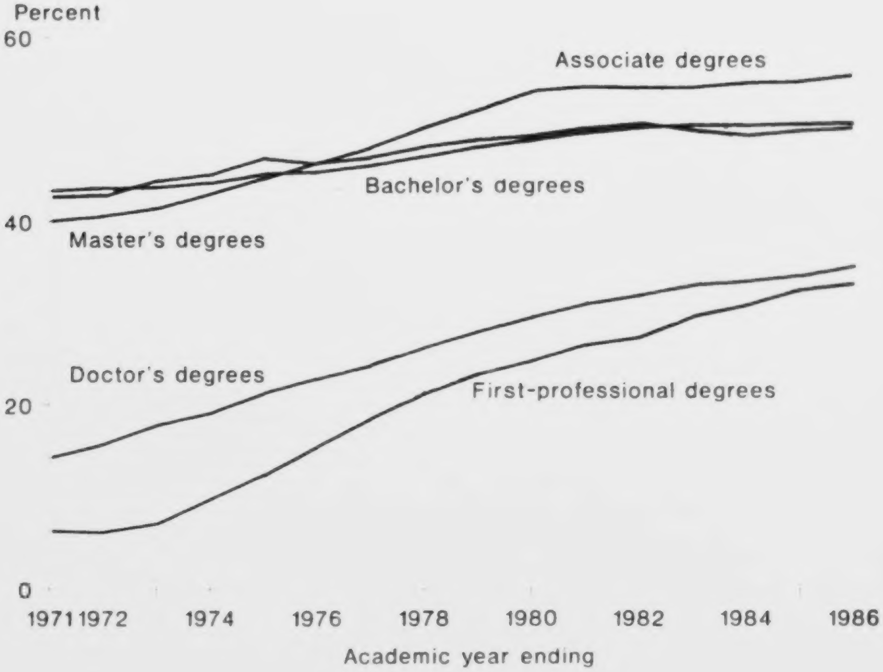
Chart 2:7 Percent of degrees earned by women, by degree level: Academic years ending 1971–1986



SOURCE: U.S. Department of Education, National Center for Education Statistics, surveys of degrees conferred, various years.

Indicator 2:8 Fields of study among women

- **Women earned an increasing share of bachelor's and master's degrees awarded in business and management between 1971 and 1986.**
- **During that period, women made solid gains in other fields as well, including the life, physical, and computer sciences.**
- **In general, women increased their presence in most major fields at all degree levels over those years.**

Since the early 1970s, women have increased their share of degrees at all levels. An important question is whether the gains have occurred in all fields of study or have been more pronounced in some than in others. A related question is whether women have increased their presence in fields where they were previously underrepresented or primarily in fields that traditionally have attracted more women.

Between 1971 and 1986, women increased their share of degrees in nearly all major fields at all degree levels. Most of these gains occurred because women were earning more degrees in the fields. Some of the gains, such as in mathematics, however, were largely the result of substantial declines in the number of degrees awarded to men.

The most notable gain, reflecting sizable increases in both the number of degrees awarded to women and women's preferences for the field, was in business and management. Over the 1971 through 1986 period, the proportion of business and management degrees awarded to women rose from 9 to 46 percent at the bachelor's level and from 4 to 31 percent at the master's level.

Women made important inroads in the life, physical, and computer sciences, as well. At all levels, they received a larger number and share of the degrees conferred in each of these fields in 1986 than they did in 1971. Despite substantial gains, however, women have not reached parity with men in many scientific and technological fields. They continue to earn a much smaller proportion of the degrees conferred at all levels in the physical and computer sciences, engineering, and, except at the bachelor's level, mathematics.

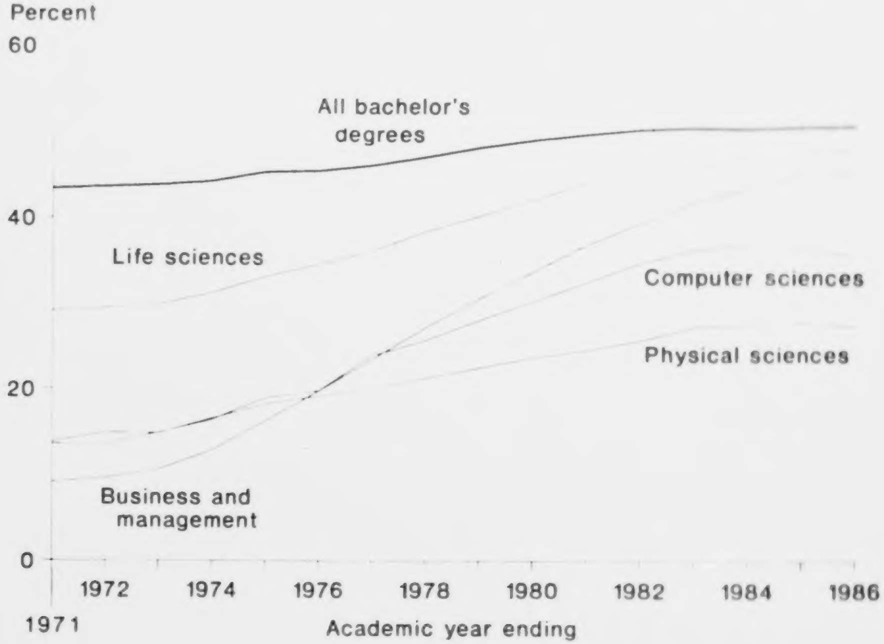
Chart 2:8 **Percent of bachelor's degrees in selected fields earned by women: Academic years ending 1971–1986**



SOURCE: U.S. Department of Education, National Center for Education Statistics, surveys of degrees conferred, various years.

Indicator 2:9 Degrees earned by foreign students

- **From 1977 to 1985, foreign students earned an increasing proportion of the bachelor's and graduate degrees awarded by American colleges and universities.**
- **The presence of foreign students is most pronounced at the master's and doctor's levels, particularly in the natural and computer sciences and engineering, where they earned about 1 out of every 4 degrees in 1985.**

The size of the foreign student population in the Nation's colleges and universities is significant for several reasons. It can affect enrollment levels and, in turn, influence the amount and allocation of material, personnel, and financial resources. It may also affect U.S. economic competitiveness, depending on whether students stay in this country to work or whether they return to their homelands after completing their studies.

Between academic years ending 1977 and 1985, the number of foreign students [1] graduating from American higher education institutions and the proportion of degrees awarded to these students rose at all degree levels. Much of the increase occurred in the natural sciences, especially mathematics, the computer sciences, and engineering, but considerable growth took place in nonscientific fields, as well. In contrast to foreign students, the number of Americans receiving master's and doctor's degrees declined, and the number receiving baccalaureate degrees increased comparatively little.

An important question in assessing the economic impact of foreign students is whether they return to their countries after receiving their degrees or remain in this country for further study or work. Of those earning doctorates in the natural and computer sciences and engineering in 1987, 36 percent had definite plans for employment or postdoctoral study in the United States.[2] Ten years earlier, 28 percent had had such plans.

---

[1] Foreign students are non-United States citizens holding temporary visas.

[2] Information on postgraduation plans is available only for doctorate recipients.

Indicator 2:10 Earnings of young adults, by educational attainment

- **Among young adults working year-round and full-time, the college-educated generally earned more annually during the 1978 to 1988 period than those who had completed only 4 years of high school, regardless of race or sex.**
- **The earnings advantage of the college-educated was more pronounced among those who had completed 4 or more years of college than among those who had completed only 1-3 years.**
- **Among those with 4 years of college, the earnings advantage was most substantial among women and blacks.**

Numerous studies have examined the effects of education on an individual's earning potential.[1] There is considerable disagreement about how education affects earnings, how great the effect is, and the influence of other factors, such as innate ability and socioeconomic status. Still, most agree that there is a link between the amount of education one receives and one's earnings.

From 1978 to 1988, college-educated young adults, regardless of race or sex, earned more than young adults with only a high school education.[2] This earnings gap was greater for those who had completed 4 or more years of college than for those who had completed 1-3 years. To illustrate, in 1988, whites with 4 or more years of college earned 41 percent more than whites with 4 years of high school, whereas those with 1-3 years of college earned only 12 percent more.

The earnings advantage of college-educated young adults with at least 4 years of college was most pronounced among women and among blacks. College-educated men and whites also had an earnings advantage, but it was less prominent.

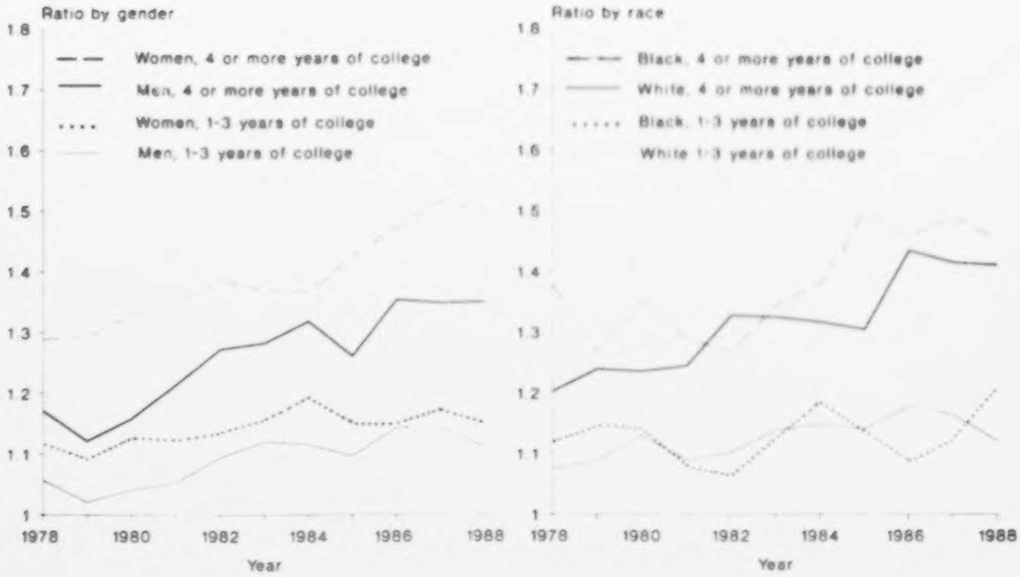
Chart 2:10 Ratio of earnings of year-round, full-time workers, 25–34 years old, with college to earnings of those with 4 years of high school: 1978–1988



SOURCE: Bureau of the Census, *Current Population Reports*, March of various years, unpublished tabulations.

Indicator 2:11 Higher education spending on research and development

- **Doctorate-granting institutions spent increasing amounts (in constant dollars) on research and development (R&D) between fiscal years 1972 and 1987.**
- **The Federal Government remains the primary source of R&D expenditures at doctorate-granting institutions, but during the 1980s its role has been declining.**

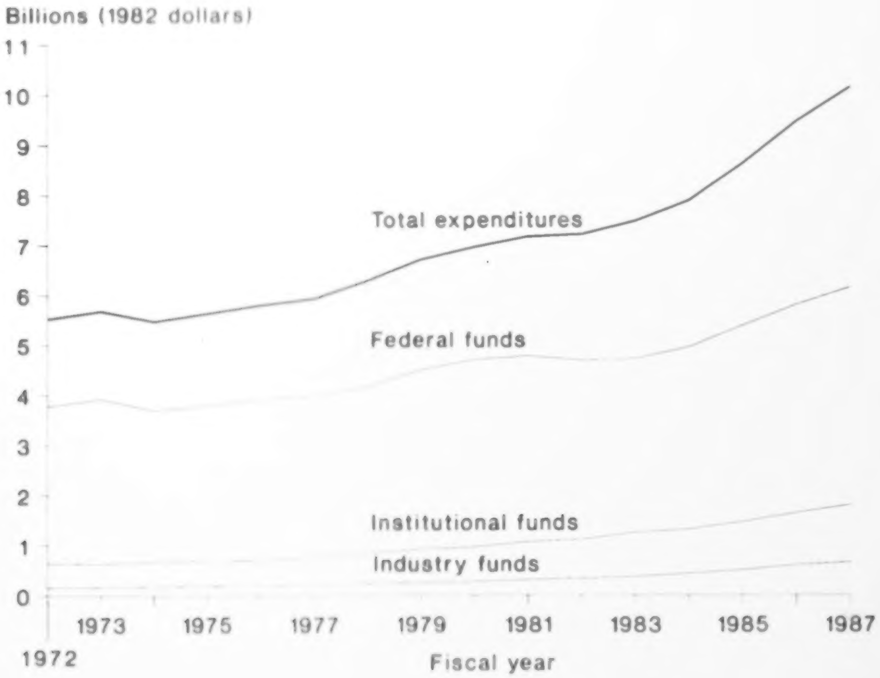
The Nation's institutions of higher education are an important source of new scientific and technological knowledge. Much of this knowledge comes from doctorate-granting institutions, which spend nearly all the R&D funds available to higher education. The condition of the R&D effort at those institutions is, therefore, viewed by many as vital to the Nation's economic health and its competitiveness in world markets.

Between fiscal years 1972 and 1987, constant dollar R&D expenditures at doctorate-granting institutions increased by more than 80 percent. Growth occurred throughout most of the period, with a slight decline in 1974, and a slowdown in the early 1980s. The rate of growth in 1987 was lower than in the previous 2 years but higher than that for any other year during the 1972 through 1987 period. The institutions' share of total U.S. R&D spending increased during the mid- to late-1980s, regaining from declines earlier in the decade.

Federal funds remain by far the largest source of R&D expenditures at doctorate-granting institutions. Although these funds increased 63 percent, after inflation, during the 1972 through 1987 period, the relative importance of Federal funds has dropped. Federal funds constituted 61 percent of the R&D expenditures at these institutions in 1987, down from 68 percent in 1972. Over the same period, industry funds increased from 3 to 6 percent and institutional funds from 12 to 18 percent of R&D expenditures.

SOURCE: National Science Board, *Science & Engineering Indicators—1987*, 1987. National Science Foundation, *Early Release of Summary Statistics on Academic Science/Engineering Resources*, October 1988 (based on Scientific and Engineering Expenditures at Universities and Colleges survey, various years).

Chart 2:11 Research and development expenditures, in constant 1982 dollars, at doctorate-granting institutions, by source of funds: Fiscal years 1972–1987



SOURCE: National Science Foundation, Scientific and Engineering Expenditures at Universities and Colleges survey, various years.

Indicator 2:12 Revenues of colleges and universities

- **State and local appropriations are the largest source of funds for public institutions (58 percent) but a negligible source (1 percent) for private institutions.**
- **Private institutions depend primarily on tuition and fees as a source of revenue (53 percent).**

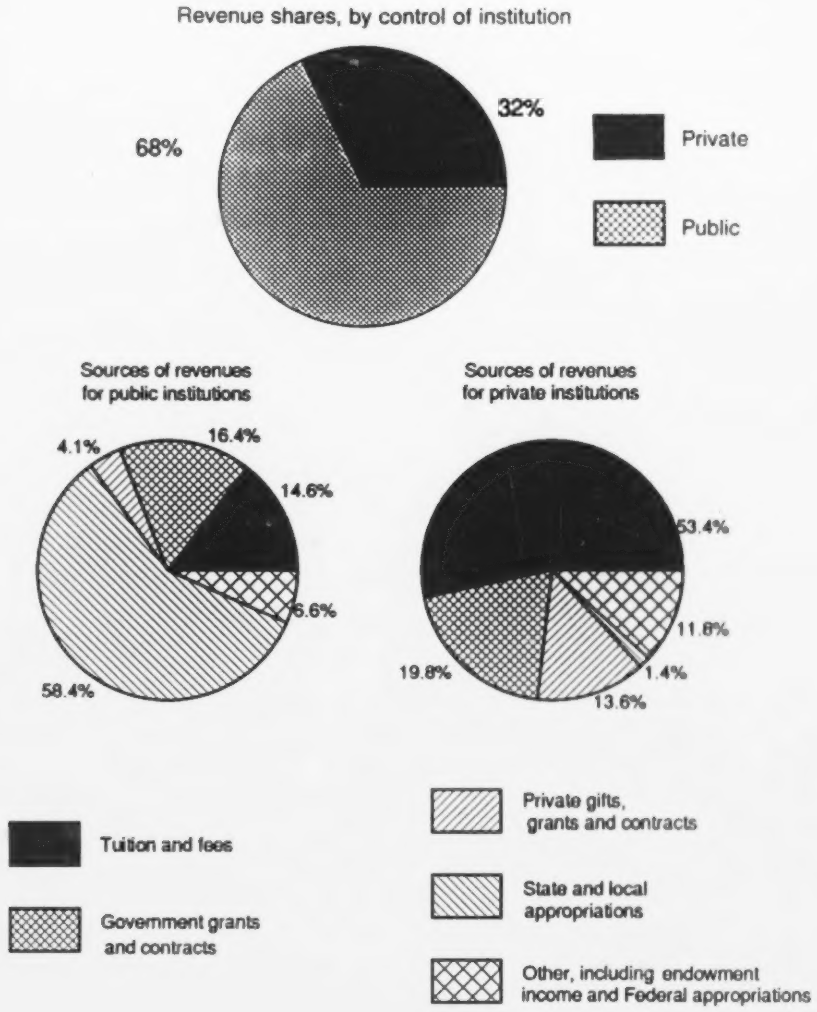
This country contains more than 3,000 colleges and universities—from community colleges, to liberal arts colleges, to professional schools, to research universities. About 1,500 of these institutions are governed by localities or by States primarily to serve their populations. Some 1,800 more are under private control, some religious and some independent. All institutions of higher education are supported by the same array of funding sources, but to widely varying degrees, depending upon whether they are publicly or privately controlled. These sources in turn are affected by a number of factors, including fluctuations in the economy and perceptions of whether investments, be they in the form of taxes, gifts, or tuition payments, are yielding expected benefits to individuals or to the country.

For public institutions, State and local appropriations were by far the most important source throughout the period from 1976 to 1986. The second most important source in 1986 was government grants and contracts, most of which came from Federal sources. In the early years of the period, however, tuition and fees had been the second largest source of revenue for public institutions.

Private institutions relied primarily on tuition and fees and secondarily on government grants and contracts during the 1976 through 1986 period. These institutions also derived a large share of their income from nongovernmental gifts, grants, and contracts (14 percent) in 1986.

SOURCE: U.S. Department of Education, National Center for Education Statistics, *Digest of Education Statistics, 1988* (based on the HEGIS surveys Financial Statistics of Institutions of Higher Education, various years, and Fall Enrollment in Colleges and Universities, various years).

Chart 2:12 Shares and sources of revenues for public and private institutions of higher education: Fiscal year 1986



SOURCE: National Center for Education Statistics, *Digest of Education Statistics, 1988.*

Indicator 2:13 Allocation of expenditures per student and tuition levels

- **Expenditures for instruction, research, and administration, as well as undergraduate tuition charges, rose considerably more than inflation during the mid-1980s at both public and private universities.**
- **Since the early 1980s, tuition has increased proportionately more than instructional expenditures at all types of public and private colleges and universities.**

Rising college tuition is of considerable concern to policymakers, educators, and students and their families. Why tuition continues to climb is a hotly debated subject. Information on where colleges and universities spend their money and how expenditure patterns have changed in relation to tuition enhances the public debate.

With few exceptions, expenditures per full-time-equivalent (FTE) student, after inflation, were higher in academic year 1985-86 than in 1976-77 at all types of public and private, nonprofit institutions.* Much of the rise has occurred since the early 1980s. Administrative expenditures grew substantially, particularly at private universities, where they were 39 percent higher in 1986 than in 1977. Expenditures on instruction also grew between those years, but less than administrative expenditures. At universities and other 4-year institutions, especially public ones, expenditures on research, a major function of higher education, also were higher in 1986 than in 1977. Expenditures for scholarships and fellowships were up sharply at all types of private institutions. They increased comparatively little at public universities, however, and actually declined at other types of public institutions.

Following declines in the late 1970s, average undergraduate tuition and fees, adjusted for inflation, rose sharply at all types of public and private institutions during the first half of the 1980s. They grew proportionately more than comparable increases in instructional expenditures but, except at 2-year institutions, less than administrative expenditures. At all types of private institutions, expenditures for scholarships and fellowships grew proportionately more than tuition charges. This was not the case at public institutions, however.

---

* This indicator presents expenditure data in indexed form where 1977 = 100. For actual dollars spent, see source described below.

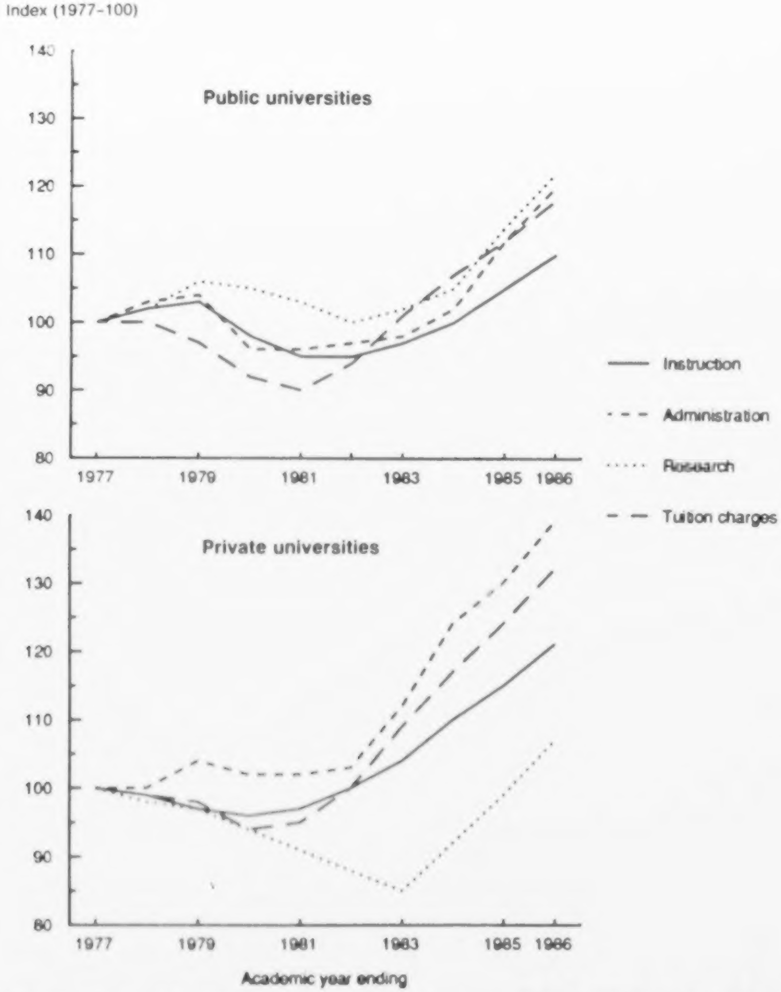
Chart 2:13 Index of selected expenditures per full-time-equivalent student and average undergraduate tuition charges (in constant dollars) at public and private universities: Academic years ending 1977–1986



SOURCE: National Center for Education Statistics, surveys of Institutional Characteristics of Colleges and Universities, Fall Enrollment in Colleges and Universities, and Financial Statistics of Institutions of Higher Education, various years.

Indicator 2:14 Faculty salaries, by academic rank

- **During most of the 1970s and into the early 1980s, college faculty salaries at both public and private institutions steadily lost ground to inflation.**
- **Since the early 1980s, faculty salaries have consistently outpaced inflation, but, by 1986, salary increases had not been large enough to restore purchasing power to early 1970s levels.**

College faculty salaries are of interest for two reasons. First, they are a significant component of college and university expenditures. Second, they can affect higher education's ability to attract and retain qualified instructional personnel.

The salaries of full, associate, and assistant professors [1] more than doubled between academic years ending 1972 and 1986. After adjusting for inflation, however, they declined substantially. Between the peak in 1973 and the low point in 1981 or 1982, their purchasing power dropped by a little over 20 percent. After that, inflation-adjusted salaries climbed steadily upward. However, by 1986, the latest year for which data are available, the increases had not been big enough to compensate for earlier losses. The trends outlined here occurred at public as well as private institutions and at universities, other 4-year, and 2-year institutions.

To get a perspective on changes in college faculty salaries, it is useful to compare them with changes in the salaries of other professions. During the 14-year period from 1971–72 to 1985–86, particularly in the late 1970s and early 1980s, the salaries of faculty increased more slowly than those of persons in six other professional occupations employed in medium-sized and large private firms.[2] The average salary of a full professor, for example, increased 130 percent over the period, whereas the average salary of an attorney increased 174 percent.

---

[1] This indicator displays salary changes between academic years 1971–72 and 1985–86 for three categories of full-time instructional staff on 9- or 10-month contracts—full professors, associate professors, and assistant professors.

[2] The occupations are: accountant, auditor, attorney, chief accountant, chemist, and engineer. Medium-sized and large firms are those employing 50 or more workers.

SOURCE: National Center for Education Statistics, survey of *Salaries, Tenure and Fringe Benefits of Full-Time Instructional Faculty*, various years.

Indicator 2:15 New doctorates with jobs in higher education, by field

- **The proportion of new doctorate recipients with definite employment commitments in the United States who had jobs in American colleges and universities declined between 1971 and 1981. After 1981, the proportion with such jobs remained generally stable.**
- **The size and pattern of the declines varied depending upon the field of study. They were greatest in the social and behavioral sciences, natural sciences, and education.**

The infusion of new talent into a profession is considered important to its intellectual vitality and growth. The tightening of the academic labor market in recent years has raised several questions related to this issue. One relates to the age distribution and experience of the labor pool available to replace retiring faculty. Another concerns the vitality of the basic research program in the Nation's universities. Trend data on newly educated doctoral recipients in different fields who take jobs in colleges and universities provide information relevant to the discussion of these matters.

Among new doctorates with definite employment commitments in the United States upon completion of their degrees, the proportion with jobs in colleges and universities fell during most of the period from 1971 to 1981 and then leveled off.*

The social and behavioral sciences, followed by the natural sciences and education, experienced the greatest drop in the proportion of new doctorates entering the academic labor market between 1971 and 1981. In contrast to most fields, this downward trend continued in the social and behavioral sciences during much of the 1980s. Natural scientists were more likely to shift to industry than to other employment sectors, while educators gravitated toward elementary and secondary education. Social and behavioral scientists, on the other hand, favored nonprofit organizations.

---

* A "definite commitment" is defined as a signed contract, acceptance of a formal offer, etc. This indicator pertains only to employment commitments in the United States. Jobs in higher education include those in teaching, research, administration, and other areas but not postdoctoral fellowships.

C. Context: Student Characteristics

Indicator 2:16 College and university enrollment, by type and control of institution

- **Total enrollment in colleges and universities increased by nearly 4 million (45 percent) between 1970 and 1983 and then increased by only 4 percent from 1983 to 1988.**
- **Between 1970 and 1983, enrollment growth was greatest in 2-year institutions, more than doubling in size from 2.2 million to almost 4.7 million students.**

Colleges and universities are regularly grouped by the predominant length of programs they offer, 2-year or 4-year, and whether they operate under public or private control. Institutions in each category address somewhat different student needs. Enrollment trends in these various types of institutions may indicate changing demand for the different types of services offered.

Between 1970 and 1983, enrollment in colleges and universities rose by 45 percent, from 8.6 million to 12.5 million. While the number of students at 4-year institutions grew by 22 percent, enrollment in 2-year institutions grew by 112 percent, reflecting, among other things, an increasing interest in higher education by the nontraditional, older, and part-time student. Public institutions, which enroll three times as many students as private institutions, increased their enrollments at a faster rate than private ones. Since 1983, enrollments at all types of institutions have been relatively steady, but in 1987 and 1988 enrollments were up slightly from 1985 levels.

Enrollments may also be measured in terms of full-time-equivalent students (FTE). For private schools, percent changes in FTE enrollments during the 1970s and early 1980s are not considerably different from the actual enrollments presented here. For public 2-year schools, however, the 1970–1983 enrollment increase in FTEs was only 85 percent; the headcount increase was 112 percent. The difference reflects the large number of students attending part-time (see *Indicator 2:17*).

In 1988, public institutions accounted for 78 percent of all higher education enrollment, and 2-year colleges accounted for 36 percent of all such enrollment.

C. Context: Student Characteristics

Indicator 2:17 Selected characteristics of students in higher education

- **Between 1970 and 1988, the proportion of part-time students in institutions of higher education increased from 32 to an estimated 43 percent.**
- **The proportion of women enrolled also rose during that time from 41 to 54 percent.**
- **The proportion of students 25 years old or older rose from 28 percent in 1972 to 39 percent in 1986.**

Changes in the composition of the enrollment in higher education signal changes in the larger society. For example, enrollment changes may reflect evolving needs of the labor force or a shift in the interest or ability of individuals to attend higher education.

In 1970, the "typical" college student was a male undergraduate between the ages of 18 and 24 attending full time. From 1970 to 1988, total enrollment in higher education increased substantially. But this increase was not uniform for all groups of students. While the number of all students grew, gains were proportionally greater for part-time students, women students, and older students. However, in that time, the proportion of graduate and professional students changed little. As a result of these factors, the "typical" college student in 1988 was a female undergraduate, with an increasing likelihood that she was over 25 years old, and attending part-time.

NOTE: Data for this indicator come from an NCES survey of all colleges and universities. Therefore, the enrollment figures differ somewhat from indicators where data from the Bureau of the Census survey of households are used.

C. Context: Student Characteristics

Indicator 2:18 College enrollment, by selected age groups

- **Between 1980 and 1986, college enrollment increased 9 percent, while the 18- to 24-year-old population decreased 8 percent.**
- **Rises in the enrollment rates of 18- to 24-year-olds, and of persons aged 25 and older were two factors contributing to the enrollment increase.**

College education in the United States has shown enormous growth in the past 40 years. In part, this growth reflects the 20th century need of business, industry, and government for a highly skilled and educated work force. Since 1950, enrollment has swelled by over 400 percent, while the number of institutions rose almost 60 percent.[1] Throughout the past decade, however, many analysts and college administrators have expressed concern that the 1980s would be a period of declining enrollment in college education. Some analysts saw in the shrinking population of 18- to 24-year-olds evidence of coming decreases in enrollment.[2]

Contrary to these fears, although the 18- to 24-year-old population declined 7.8 percent between 1980 and 1986, total enrollment of 18- to 24-year-olds actually increased 2.4 percent. A modest increase in their participation rate (from 24.7 percent to 27.4 percent) had helped offset the decline in the age group. Without this increase in participation, enrollment in 1986 would have been 734,000 below the actual figure of about 7.4 million.[3]

The rise in college enrollment in the 1980s was also due to more older students who enrolled to prepare for career changes, to upgrade knowledge for current positions, or for enjoyment. In 1980, 2.9 percent of the population aged 25 years and over were enrolled in higher education. Between 1980 and 1986, the population in this age group increased by 12.3 percent. Had the same percentage of this age group continued to enroll in higher education, the number of students would have grown by approximately 475,000. However, a small rise in the participation rate of this population, from 2.9 to 3.2 percent, brought the enrollment increase to about 878,000. This population is growing, and an increasing number of students may come from this age group.

TEXT SOURCE: U.S. Department of Education, National Center for Education Statistics, *Digest of Education Statistics, 1988*. U.S. Department of Commerce, Bureau of the Census, "School Enrollment—Social and Economic Characteristics of Students, October [various years]"; *Current Population Reports*, Series P-20; and unpublished tabulations.

Indicator 2:19 Enrollment patterns in higher education, by race and ethnicity

- **Among 18- to 24-year-olds, participation rates for blacks and Hispanics in higher education are below those of whites.**
- **Participation rates among whites have increased since the mid-1970s.**
- **Black and Hispanic participation rates in the mid-1980s are higher than they were in the early 1970s.**

Equal access for all qualified youth has long been a major goal of our education system. One measure of national progress toward that goal is the participation rates [1] of various populations in higher education. Changes in participation rates may reflect many different factors, such as changes in values associated with higher education, in the ability to afford higher education, or in the quality of secondary schooling. Such changes may also alert higher education institutions to the need for altering policies or offerings.

The share of whites enrolled in higher education declined in the first half of the 1970s, then held steady until it increased through the 1980s. The proportion of black and Hispanic 18- to 24-year-olds enrolled in higher education increased in the early 1970s but declined in the second half of the decade. By the mid-1980s, the rates for both groups were above those of the early 1970s.

Throughout the period, participation rates of blacks and Hispanics were lower than those of whites. Enrollment of whites between 1970 and 1980 ranged between 25 and 27 percent. Since 1983, it equalled or exceeded 28 percent. Below are the participation rates of 18- to 24-year-olds in higher education:

Year	White	Black	Hispanic [2]
1972	26	18	13
1976	27	23	20
1980	26	19	16
1986	28	22	18

---

[1] Participation rates represent the proportion of a given subgroup enrolled in an institution of higher education. For example, the participation rate for 18- to 24-year-old blacks is calculated as 18- to 24-year-old black college students as a percent of all black 18- to 24-year-olds.

[2] Hispanics may be of any race.

* The National Center for Education Statistics recognizes 10 first-professional degree fields: chiropractic, dentistry, law, medicine, optometry, osteopathy, pharmacy, podiatry, theology, and veterinary medicine.

NOTE: Data for academic year ending 1983 were not fully edited and thus are not available for publication. The total number of degrees reported in this table is lower than the total actually conferred because of missing racial/ethnic data. The numbers reported for 1977 and 1979 do not include degrees conferred by U.S. Service Schools (0.4 percent or less of total degrees).

SOURCE: U.S. Department of Education, National Center for Education Statistics, *Digest of Education Statistics*, various years (based on the HEGIS survey Degrees and Other Formal Awards Conferred).

* The technical/professional category does not include computer sciences and engineering.

NOTE: Foreign students are non-United States citizens on temporary visas. The total number of degrees reported in this table for each degree level and field of study is lower, but by no more than 2 percent, than the total actually conferred. This is because racial/ethnic citizenship status data were not imputed for some of the institutions that did not report such data.

SOURCE: U.S. Department of Education, National Center for Education Statistics, *Digest of Education Statistics*, various years (based on the HEGIS survey Degrees and Other Formal Awards Conferred, 1980-81 and 1984-85 and Office for Civil Rights, Data on Earned Degrees Conferred by Institutions of Higher Education by Race, Ethnicity, and Sex, Academic Years 1976-77 and 1978-79).

---

[1] Due to differences in survey design, the total number of doctorates received by foreign students obtained by the National Science Foundation's survey is smaller than that obtained by the U.S. Department of Education's survey (see table 2:9–1).

[2] Includes a small proportion (less than 1 percent) whose plans are unknown.

[3] Physical and life sciences, mathematics, computer and information sciences, and engineering.

1987	11,930,997	10,136,786	9.6	2.8	100.0	60.6	8.4	6.4	17.7	6.9

[1] Data for 1980 through 1986 revised from previously published figures.

[2] Based on GNP implicit price deflator; base year = 1982.

NOTE: R&D expenditures include separately budgeted expenditures for basic research and for applied research and development. They do not include expenditures by university-administered, federally funded research and development centers (FFRDC's). R&D expenditures at doctorate-granting institutions made up 98.6 percent of total academic R&D expenditures in 1986. Detail may not add to totals due to rounding.

NOTE: Tuition charges (tuition and fees) are in constant dollars, adjusted by the Consumer Price Index for the academic year (July 1–June 30). They are for the entire academic year and are average charges paid by students. They were calculated on the basis of full-time-equivalent undergraduates. Tuition at public institutions is the charge to in-State students. The amount at private institutions includes charges at both nonprofit and proprietary schools.

NATIONAL CENTER FOR EDUCATION STATISTICS

Announcement August 1989

NCES Releases Condition of Education Report on Postsecondary Education

The proportion of degrees earned by women increased at all levels between 1971 and 1986. By 1986, women were earning more than one-half of the associate degrees, about one-half of the bachelor's and master's degrees, and about one-third of the doctor's and first-professional degrees. Women also earned an increasing share of the bachelor's and master's degrees awarded in business and management between 1971 and 1986. In addition, they made inroads in other fields, including the life, physical, and computer sciences.

These facts and more can be found within the pages of the *Condition of Education, 1989: Volume 2, Postsecondary Education*, recently released by the National Center for Education Statistics (NCES) of the U.S. Department of Education's Office of Educational Research and Improvement. Included in the volume are data on postsecondary completions, economic outcomes, fiscal resources, human resources, and student characteristics.

This year, as in 1988, NCES has published indicators—key data that measure the health of education, monitor important developments, and show trends in major aspects of education—in three volumes. *The Condition of Education* report encompasses the first two volumes, the first addressing elementary and secondary education and the second, postsecondary education. The third volume, *1989 Education Indicators*, includes the text, tables, and graphs from the first two volumes, plus the technical supporting data, supplemental information, and data sources.

Copies of *The Condition of Education, 1989: Volume 2, Postsecondary Education* are available for $6.50 each from the Superintendent of Documents, U.S. Government Printing Office, Washington, DC 20402. Ask for stock number 065–000–00378–3. *The Condition of Education, 1989: Volume 1, Elementary and Secondary Education* is also available from the U.S. Government Printing Office, stock number 065–000–00377–5, for $5.50 each. You may pay by check or money order (payable to the Superintendent of Documents), VISA, or Mastercard. For your convenience, an order form is printed on the back of this announcement.
